Beginner's Start Guide (Made Really Simple)

It's okay if computers/AI are new to you. Just follow the steps below **exactly**. (Korean version: [왕초보_시작_가이드.md](#) · Full manual: [README.en.md](#))

Before You Start (Prerequisites)

- A **Windows PC** and an **internet connection**
- A **ChatGPT account** (you can create one for free if you don't have one)
- **Node.js** (a free program): if it's missing, the kit **helps install it for you**. No need to install it in advance.

Step 1. Run the File

1. **Double-click** the file [Codex-CLI_One-Click_Kit.bat](#) .
2. Success when a **black window** opens showing a Korean menu.

💡 A blue "Windows protected your PC" warning appeared? That's normal — it shows for new files. Click [More info](#) → [Run anyway](#) .

Step 2. Start (the easiest way)

- When the menu appears, just press the [Enter](#) key once. (= Start Codex)
- The kit checks things for you, and if Codex is missing it **helps install it** and then starts.
 - If it asks to install, press [y](#) → Enter.

```
/=====\  
|   >>>  [  ENTER  ]  <<<   |  
\=====/  
Press Enter once to start right away!
```

Step 3. Log In (first time only)

1. A web browser **opens automatically** with the ChatGPT login screen.
2. Log in with your usual **ChatGPT account** (a free account works too).
3. For security, enabling **two-factor authentication (MFA)** is recommended.

Your login is saved on your PC at `C:\Users\(you)\.codex\` , so you won't need to log in again next time.

Step 4. Ask It to Do Things (How to Use)

- When it starts, you'll first see **"try asking like this"** examples. You can copy them as-is.
- In the black window, type **what you want, in plain language**, and press `Enter` :
 - `Tell me what files are in this folder`
 - `Explain in simple terms what this code does`
 - `Make a simple notepad program`
- **To quit**, type `/quit` , or press the `Ctrl` and `C` keys together.

Understanding Modes (Safety)

This kit has two modes. The current mode is shown next to "모드 :" (Mode) at the top of the screen.

Mode	What it means
Edit files (default)	The AI can create/modify files only inside the current folder . ("Make a notepad app" actually works.) It can never touch outside the folder or the rest of your PC.
Read-only	The AI never touches files and only reads. The most conservative option.

- To switch, use menu `5` (**Change mode**). Once set, it's remembered.
- If you start in a **personal folder** like Desktop or Documents with "Edit files", the kit asks **"continue?"** once more to keep you safe.

Full Menu Explanation

Press	What happens
Enter / 1	Start Codex immediately
2	Start in another folder (Desktop, Documents, new folder, etc.)
3	Install / Reinstall
4	Update to the latest version
5	Change mode (edit files ↔ read-only)
6	When it doesn't work — auto-diagnose (saves 진단 결과.txt)
7	Remove (uninstall Codex)
H	View help · Q Quit

FAQ

Q. Do I need to run as administrator? → No. Just double-click.

Q. At first it says “Enter = start / press R for read-only”. → Just press **Enter** (the recommended mode that can also create files). If you prefer read-only, press **R**. Choose once and it's remembered.

Q. The install seems stuck. → It usually takes 1–2 minutes. It's downloading from the internet, so please wait a moment.

Q. It says the **codex command isn't recognized.** → **Restart your PC**, then run again. (Your PC may need a moment to recognize the newly installed location.)

Q. I want to remove it. → Menu **7** → **y**. For “Also delete settings?”, usually press **n** (handy next time). To restore, reinstall via menu **3**.

Q. I'm stuck on something. → Press menu **6** **diagnose** and capture the screen — it makes finding the cause easy. Keep this kit's files **together in one folder** and don't move them apart.

Troubleshooting (Full Table)

Symptom	Cause (in plain terms)	Fix
<code>codex</code> not recognized / "command not found"	PC doesn't know the install location yet (PATH)	Restart the PC , then run again. If it persists, menu <code>6</code> diagnose
Install failed	Internet dropped / temporary error	Check internet, then reinstall via menu <code>3</code>
Login page won't open	Firewall/network blocking	Check internet. Paste the on-screen URL into a browser manually
<code>429</code> / "Too many requests"	Used too much briefly (usage limit)	Wait the shown time, then retry
Says Node version is too old	Outdated Node.js	Reinstall the latest LTS (22+) from https://nodejs.org
Login keeps blocking	Account security settings	Enable two-factor (MFA) on your ChatGPT account, then retry
Korean text looks broken	Font/encoding	Close the window and run again. If it persists, capture the menu <code>6</code> diagnose result

If still confused, capture the menu `6 diagnose` screen and paste it to an AI (ChatGPT/Claude) to ask — it makes finding the cause much easier.

Common Commands (When Typing Directly)

The menu is usually enough. Below is for typing directly into the black window.

Command	Meaning
<code>codex</code>	Start interactively (easiest)
<code>codex "task description"</code>	Run a task directly — e.g. <code>codex "explain this code"</code>
<code>codex exec "task"</code>	Run once without conversation
<code>codex --version</code>	Show installed version
<code>codex logout</code>	Log out
<code>codex --sandbox read-only</code>	Read-only (won't modify files)
<code>codex --sandbox workspace-write</code>	Allow edits only inside the current folder
<code>/help</code>	(while Codex is running) See available features

Workflow (At a Glance)

```
[Double-click] → [Korean menu] → [Enter = Start]
→ (first time only) log in to ChatGPT
→ choose a working folder
→ ask in plain language → AI answers or creates files
→ quit with /quit → back to the menu
```

File / Storage Locations

- **This kit's files:** keep them together in one folder (`.bat` , README, guides, cheat sheet, LICENSE).
- **Kit settings** (remembers mode & last folder): `C:\Users\<you>\AppData\Local\codex-cli-one-click-kit\`
- **Login info:** `C:\Users\<you>\.codex\`
- **Diagnosis result:** `진단결과.txt` (created in this folder by menu `6`)

Good to Know

- **Cost:** A free ChatGPT account has limited use; Plus or higher allows more. Using an API key is billed per usage.
- **Always review** AI-generated code and commands; when unsure, try **read-only** mode first.
- For more, see the full manual `README.en.md` .
