

README.en.md

Codex CLI One-Click Kit

A Korean-friendly helper that lets even first-time computer/AI users **install, run, and remove** OpenAI's **Codex CLI** (an AI coding assistant) by **double-clicking a single file**.

한국어 README: [README.md](#) · Beginner Guide: [Beginner_Guide_EN.md](#)

0. 30-Second Quick Start

1. **Double-click** `Codex-CLI_One-Click_Kit.bat` .
2. When the menu appears, just press `Enter` once. (= Start Codex)
3. On first run, **log in to ChatGPT** in the browser. Done — now type **what you want, in plain language**, into the black window.
 - Example: `Explain what files are in this folder`
 - To quit: type `/quit` , or press `Ctrl` + `C`

For a step-by-step walkthrough, see the [Beginner Guide](#).

1. What Is This?

- **Codex CLI**: OpenAI's AI tool that does things like "explain this code" or "make a simple notepad app" **when you ask in plain language**, right inside a folder on your PC.
- **This kit**: A **menu program** that makes installing and using that tool easy.
 - It is an **unofficial helper**, not the official program. It does **not** bundle Codex; it only helps **install it from the official source (npm)**.

2. Prerequisites / Required Software

Item	Required?	Notes
Windows PC	Required	Works on Windows 10/11.
Node.js (free)	Required	Needed to run Codex. If missing, the kit tells you and tries to auto-install it when possible. Manual download: https://nodejs.org/ → the LTS version on the left.
ChatGPT account	Required (one of)	Log in to use. A free account works; for heavier use, Plus or higher is recommended.
or OpenAI API key	Optional	You can use an API key instead of an account (billed per usage).
Internet connection	Required	Needed for install, login, and AI responses.

Cost note: Using Codex consumes your OpenAI ChatGPT plan or API usage. Free accounts have small limits. Check OpenAI's official pricing for details.

3. Download & Install

- Place this kit folder (the folder with these files) wherever you like on your PC.
 - Important:** Keep the files (`.bat` , guides) **together in one folder**. Moving them apart can break the on-screen help.
- Double-click `Codex-CLI_One-Click_Kit.bat` .
- If Codex is missing, the kit **guides you through installation automatically**. Just press `y` → Enter.
 - Internally it runs the official command `npm install -g @openai/codex` . This usually takes 1–2 minutes.

If a blue “**Windows protected your PC**” warning appears, that’s normal (it shows for new files). Click **More info** → **Run anyway** .

4. How to Run

- Double-click** `Codex-CLI_One-Click_Kit.bat` → a black window shows a Korean menu.
- Press **Enter** (or `1`) to start Codex immediately.

5. Menu at a Glance (current version)

```
/=====\  
|   >>>  [  ENTER  ]  <<<   |  
\=====/  
Press Enter once to start right away!  
  
[1] Start Codex  
[2] Start in another folder  
[3] Install / Reinstall  
[4] Update (to latest)  
[5] Change mode (edit files <-> read-only)  
[6] When it doesn't work (auto-diagnose)  
[H] Help           [Q] Quit  
----- use with care -----  
[7] Remove (uninstall Codex)
```

Key	Action	Description
Enter or 1	Start Codex	Start immediately in the remembered folder (most used)
2	Start in another folder	Pick Desktop, Documents, Downloads, a new folder, or type a path
3	Install / Reinstall	Install Codex for the first time, or reinstall
4	Update	Upgrade to the latest version
5	Change mode	Toggle "edit files" ↔ "read-only" (remembered once set)
6	When it doesn't work	Auto-diagnose (also saved to 진단결과.txt)
7	Remove	Uninstall Codex (reversible via 3 Install)
H	Help	View commands / help
Q	Quit	Exit the menu

Input is **key + Enter**. Leading/trailing spaces are ignored, and a wrong key just re-shows the prompt — so it's safe.

6. How to Use / How It Works

1. Press **Enter** in the menu → Codex starts.
2. In the black window, type **what you want in plain language** and press Enter.
 - Explain what files are in this folder
 - Explain in simple terms what this code does
 - Make a simple notepad program
3. To quit: type `/quit`, or press **Ctrl** + **C**.

Mode (Safety) — Important

Mode	Meaning	When
Edit files (default)	AI can create/modify files only inside the current folder (never the rest of your PC)	When you want real output, e.g. "make a notepad app"
Read-only	AI never touches files (reads only)	When you only want explanations, or want to be more conservative

- Change the mode anytime in menu **5**; once set, it's remembered.
- If you start in a **personal folder (Desktop, Documents, etc.) with "Edit files"**, the kit asks for confirmation once.

7. Workflow (Overall Flow)

```
[Double-click] → [Korean menu] → [Enter = Start]
  → (first time only) log in to ChatGPT
  → choose a working folder (default: remembered folder, or [2] for another)
  → ask in plain language → AI answers or creates files
  → quit with /quit → back to the menu
```

8. File / Document Locations

Item	Location
Executable	<code>Codex-CLI_One-Click_Kit.bat</code> (this folder)
Korean README	<code>README.md</code> · English <code>README.en.md</code>
Beginner guide	<code>왕초보_시작_가이드.md</code> (Korean) · <code>Beginner_Guide_EN.md</code> (English)
Errors & commands cheat sheet	<code>오류대처_명령어_치트시트.md</code>
License	<code>LICENSE</code> (Apache-2.0)
PDF documents	<code>*.pdf</code> of the docs above (same folder)
Kit settings	<code>C:\Users\<you>\AppData\Local\codex-cli-one-click-kit\</code> (remembers mode & last folder)
Codex login info	<code>C:\Users\<you>\.codex\</code> (asked separately on removal)
Diagnosis result	<code>진단결과.txt</code> (this folder, created by menu 6)

9. Common Commands

The menu is usually enough. Below is for typing directly in the black window (terminal).

Command	Meaning
<code>codex</code>	Start interactively
<code>codex "task description"</code>	Run a task directly (e.g. <code>codex "explain this code"</code>)
<code>codex exec "task"</code>	Run once without conversation
<code>codex --version</code>	Show installed version
<code>codex logout</code>	Log out
<code>codex --sandbox read-only</code>	Read-only (won't touch files)
<code>codex --sandbox workspace-write</code>	Edit files only inside the current folder
<code>npm install -g @openai/codex@latest</code>	Update to latest (same as menu 4)
<code>npm uninstall -g @openai/codex</code>	Remove (same as menu 7)

10. Troubleshooting (Summary)

Symptom	Fix
<code>codex</code> command not found	Restart the PC, then run again. If it persists, menu <code>6</code> (diagnose)
Install failed	Check internet, then reinstall via menu <code>3</code>
Login page won't open	Check internet/firewall. Paste the on-screen URL into a browser manually
<code>429 / Too many requests</code>	Usage limit reached. Wait the shown time, then retry
Node version too old	Reinstall the latest LTS (22+) from https://nodejs.org

For a fuller table, see the [errors & commands cheat sheet](#) or the [Beginner Guide](#). When stuck, capture the menu `6` **diagnose** screen.

11. How to Remove

- Menu `7` → type `y` → Codex is removed.
- “Also delete login info (settings)?” → usually `n` (handy for next time).
- To restore, reinstall via menu `3`.

12. Folder Structure

```
Codex-CLI_One-Click_Kit/
├─ Codex-CLI_One-Click_Kit.bat    # Executable (double-click)
├─ README.md                    # Full manual (Korean, primary)
├─ README.en.md                 # Full manual (English)
├─ 왕초보_시작_가이드.md         # Beginner step-by-step guide (Korean)
├─ Beginner_Guide_EN.md         # Beginner guide (English)
├─ 오류대처_명령어_치트시트.md   # Errors & commands quick reference
├─ LICENSE                      # Apache License 2.0
└─ *.pdf                       # PDF versions of the docs above
```

Keep these files **together in one folder**. Moving them apart can break the help links.

13. Environment Variables

- This kit requires **no environment variables to set up**. Just double-click.
- Values the kit handles automatically:

- It adds `%APPDATA%\npm` (npm global path) to `PATH` so the `codex` command is recognized.
- Settings are stored in `%LOCALAPPDATA%\codex-cli-one-click-kit\`, and login info in `%USERPROFILE%\codex\`.
- (Optional) To use an **OpenAI API key** instead of account login, follow Codex's method (`codex login` or the `OPENAI_API_KEY` environment variable). **Never store an API key in this folder or any public location.**

14. Build · Test · Distribution

- **Build:** None needed. It's a pure Windows batch script (`.bat`) — no compilation.
- **Test:** Double-click `Codex-CLI_One-Click_Kit.bat` → if the menu appears and **Enter** starts Codex, it works. For an environment check, use menu `6 (diagnose)`.
- **Distribution:** Zip the whole folder and share it, or let people get it from the GitHub repo. The recipient just **unzips and double-clicks the** `.bat` . (The kit guides/installs Node.js and Codex.)

15. Security · Operations Notes

- This kit **contains no API keys or passwords**, and does not send your files anywhere.
 - **What you type while using Codex** is sent to OpenAI's servers for processing → **do not enter personal data, passwords, or confidential information.**
 - **Review** AI-generated code and commands **before running them**. When unsure, switch to **read-only** mode in menu `5` .
 - In folders with important data (Desktop, Documents, etc.), avoid "edit files" mode, or confirm once more when the kit's warning appears.
 - On first run, the "Windows protected your PC (SmartScreen)" warning is normal → `More info` → `Run anyway` .
 - Enable **two-factor authentication (MFA)** for login. On shared PCs, run `codex logout` when done.
-

License · Copyright · Commercial Use (Please Read)

This kit (the one-click helper) - License: **Apache License 2.0** (full text in the `LICENSE` file) - Copyright: **Copyright 2026 SoDam AI Studio** - Commercial use: Under Apache-2.0, **commercial use, modification, and redistribution are permitted**, provided that you **include the copyright notice and a copy of the license, state any changes** you made, and **do not use the "SoDam AI Studio" name/trademarks for endorsement or promotion without permission**. The software is provided "AS IS", without warranty.

Codex CLI itself (the OpenAI program this kit installs) - `@openai/codex` is **OpenAI's work**, distributed under the **Apache License 2.0**. (Repository: <https://github.com/openai/codex>) - This kit does **not** bundle or redistribute Codex; it only helps **install** it from the official npm source.

Using OpenAI Services (account · API) - To **use** Codex you need an OpenAI account (ChatGPT plan) or an OpenAI API key, and such use is governed by **OpenAI's Terms of Use and policies**. Verify the scope of commercial use, pricing, and limits in **OpenAI's official terms**.

Trademark Notice - **OpenAI**, **Codex**, and **ChatGPT** are trademarks of OpenAI. This kit is an **unofficial helper, not affiliated with OpenAI**, and implies no partnership or endorsement.

Disclaimer

- This kit is provided **"AS IS", without warranty**; you are **responsible** for the results of using it.
- **Always review** AI-generated code, answers, and commands. For folders with important data, prefer **read-only mode**, and double-check unfamiliar commands before running them.
- This kit does not send your files anywhere. However, when you use Codex, your input is sent to OpenAI's servers for processing (be careful with personal/sensitive data).
